

Upload CV & JD - Product Specs

Overview

This step provides a simple, one-step interface for users to upload their existing CV and an optional job description (JD) before entering the AI-guided CV editing. The goal is to make uploading fast and intuitive while encouraging users to provide a JD for better recommendations. As soon as the user uploads their CV (and optionally a JD), the system auto-saves their input and then shows a brief “Analyzing your CV” loading screen. This loading screen gives the impression of AI analysis with a short animated sequence, after which the user is taken into the Guided Editing interface with tailored suggestions.

UX Principles

- One goal at a screen. One step at a time
- Gamified progress (via CV Score).
- Free vs. premium UX separation.
- Simplicity triumphs all. Maximum simplicity and friction reduction. Simplify, simplify, simplify. Every detail, button, text, interaction ... must be dead simple, intuitive, frictionless
- Design with monetization in mind
 - We try to design & offer the best user experience, then find smart ways to monetize our features
- Visual & Interaction Guidelines:
 - Clean and professional: modern, minimalist interface aligning with industry standards.
 - Consistent colors and fonts: primary colors soft cyan (#E0F7FA), gentle mint green (#E6F4EA), light sky blue (#E3F2FD); typography professional yet friendly.
 - Consistent button styles: rounded corners, clear actionable text
 - Consistent typography and visual hierarchy established in previous steps
 - Intuitive interactions: clear affordances, intuitive buttons, and CTAs; maintain consistency across interactions.

High-level USP of the CV Workflow

Step	Problem/ Need	OkBuddy USP
Updating Personal Information & Recent Experiences	As a job seeker, I want to efficiently update my CV with my latest experiences and achievements, so that my CV	Guided conversational AI prompts to efficiently capture essential updates (new roles, achievements, skills).

	always reflects my most relevant and recent qualifications. Currently, I have to manually edit and decide what details to include, which is tedious, confusing, and often results in missing or poorly represented information.	Automatic AI suggestions on relevant experiences or certifications users might overlook based on industry and job role trends. Intelligent phrasing and formatting recommendations provided instantly by the LLM. OkBuddy 10x Improvement: Transforming manual, unclear, and error-prone updates into an efficient, guided, and precise process.
Showcasing Experiences with Strong, Impactful Language	As a job seeker, I want my experiences and achievements to be articulated powerfully and professionally, so that I can impress hiring managers and stand out from other candidates. Currently, I have to write descriptions manually and struggle with effectively articulating my achievements, making the process frustrating and often resulting in generic, weak descriptions.	LLM-Powered Solution: AI-driven experience rephrasing tool that transforms simple inputs into compelling, achievement-oriented descriptions. Automatic extraction and suggestion of quantifiable metrics and impactful language tailored specifically to industry and role standards. Instant variations to ensure personalized and authentic representations of user experiences. OkBuddy 10x Improvement: Professional-grade, impactful resume content generated in seconds, overcoming manual writing weaknesses.
Tailoring CV to Specific Job Requirements	As a job seeker, I want to easily tailor my CV specifically to each job's	LLM-Powered Solution: Real-time AI-driven analysis

	requirements, optimizing it for ATS systems and recruiters alike, so that my resume consistently catches the attention of hiring managers and gets past automated filters. Currently, I have to manually guess job-specific requirements and ATS screening criteria, repeatedly adjusting my CV through trial-and-error, which is tedious, anxiety-inducing, and risks immediate rejection or oversight by recruiters who spend only seconds scanning each resume.	of job postings to instantly identify critical keywords and role-specific requirements. Automated tailoring of CV content, restructuring and rephrasing skills and experiences to perfectly match the specific job description. ATS optimization checker integrated to proactively ensure formatting and keywords are optimized for both automated systems and recruiters' rapid initial scans. OkBuddy 10x Improvement: Dramatically reduces customization time from hours to seconds while significantly boosting ATS pass rates and recruiter attention.
Reviewing & Finalizing CV	As a job seeker, I want to confidently review and finalize my CV knowing it meets high professional standards, so that I can submit applications without hesitation or anxiety. Currently, I rely on self-review or uncertain methods to check my CV's quality, leading to anxiety about unnoticed errors or missed opportunities to make a strong impression during the critical initial recruiter scan.	LLM-Powered Solution: AI-powered final review providing immediate, actionable insights to enhance CV quality. Instant scoring of CV effectiveness, clarity, and alignment with professional standards and job-specific requirements. Real-time improvement recommendations ensuring high-impact, error-free submissions. OkBuddy 10x Improvement: Removes guesswork and anxiety from final CV reviews, ensuring confident submissions that clearly stand out.

Requirements for Upload Existing CV

User Story

As a job seeker, I want to easily upload my existing CV and job description (JD)

So that I can quickly receive tailored recommendations and CV optimization.

Currently, uploading CVs and inputting job descriptions manually is tedious, error-prone, and often feels disconnected and unclear.

Features & Requirements

- **Page Header:** At the top of the screen, display a clear title and subtitle to set expectations. The title is “**Tối ưu CV trong 5 phút**” (centered). The subtitle is “**OkBuddy sẽ phân tích và giúp bạn cải thiện CV, tăng cơ hội phỏng vấn**”. These explain that OkBuddy will analyze and improve the CV to increase interview chances. (All text should later be localizable via configuration.)
- **CV Upload Area:** This is the primary focus of the screen, allowing users to provide their CV file.
 - The upload area is a prominent **drag-and-drop box**, also clickable to open a file selector. Inside the box, instructive text like “**Kéo thả CV hoặc nhấn để chọn**” (Drag and drop your CV or click to select) is shown, along with an icon (e.g. a file or upload icon) in a neutral style.
 - Supported file formats are **PDF and DOCX**, and this is indicated in the UI (for example, a note near the upload box: “*Hỗ trợ định dạng PDF, DOCX*”). The file size limit **10MB** is also stated (e.g. “*Tối đa 10MB*”).
 - Before any file is uploaded, the upload box has a neutral appearance (e.g. gray or light border). A subtext below the box reassures the user about privacy, e.g. “**Dữ liệu được bảo mật và chỉ dùng để phân tích & tối ưu CV của bạn**” (Your data is secure and used only for analysis & optimization).
 - **During file upload:** provide visual feedback – show a spinner or loading animation within the drop area to indicate the file is uploading. The border or icon can change to a loading state.
 - **After successful upload:** the upload box changes to a success state with a green-highlighted border or icon. Display the uploaded file’s details clearly,

including:

- A file icon or thumbnail (representing PDF/DOCX),
 - The **filename** and **file size**,
 - A green checkmark or a label like “ **Đã tải lên thành công**” (Uploaded successfully).
 - An “X” or small **remove button** allowing the user to remove/delete the file and re-upload if they made a mistake. Clicking remove will reset the upload area to the initial state.
- **On upload error:** if the user selects an unsupported file type or a file over 10MB, display a clear error message near the upload area. For example:
 - If format not supported: “*Định dạng file không được hỗ trợ. Vui lòng tải file PDF hoặc DOCX.*” (Unsupported file format. Please upload a PDF or DOCX.)
 - If file is too large: “*File vượt quá 10MB. Vui lòng chọn file nhỏ hơn.*” (File exceeds 10MB. Please choose a smaller file.)
 - The error message should be in a friendly tone and perhaps styled in red or with an error icon. The user should be able to attempt another upload immediately without refreshing the page.
- **Job Description (JD) Input Area:** Providing a job description is **optional but encouraged** to improve the CV optimization.
 - **Section title & prompt:** Show a section title “**Mô tả công việc**” and a prompt subtitle such as “**Bạn đang apply cho một vị trí cụ thể? Thêm mô tả công việc để cải thiện & tối ưu CV, gia tăng lợi thế trước các ứng viên khác.**” This explains that if they are applying for a specific position, adding that job’s description will help OkBuddy tailor the CV improvements and give them an advantage.
 - **JD URL Field:** Provide an input field for a **job description URL** first (for convenience). This single-line text field allows the user to paste a link to an online job posting. Placeholder text could be “*Dán đường dẫn JD tại đây*” (Paste the JD link here). If the user enters a URL, the system can later fetch the job description text from that link (see Technical Plan).

- **JD Text Field:** Below the URL field, provide a larger **text box** for the job description text. This is for users to manually paste or type the job description if they have it. The text area should have a placeholder like **“Copy paste mô tả công việc tại đây...”** (Copy-paste the job description here...).
- **Priority logic:** Users may use either the URL or the text box (or both). If both are provided, the **manually pasted text takes priority** – i.e. the system will use the text in the box over the URL. (The UI can still keep both fields filled, but when processing, the text is used.)
- **Character limit:** The JD text field has a limit of **2000 characters**. When the user starts typing or pasting in this field, a character counter should appear (e.g. “x/2000”) to show how many characters have been entered. For example, if the user types “job”, the counter would show “3/2000”. If the content exceeds 2000 characters, the UI should visually warn the user (e.g. highlight the counter in red or show a message) and prevent further input beyond the limit. Exceeding the limit should also disable the primary action until resolved.
- Any JD text entered here will be **saved and later used** in the guided editing step to analyze and tailor suggestions (e.g. matching keywords, etc.). The user will not see the JD text in the editor, but the AI behind the scenes will use it for generating recommendations.
- **Primary Action – “Bắt đầu phân tích”:** The main call-to-action is a prominent **button** labeled **“Bắt đầu phân tích”** (Start Analysis) for proceeding to the analysis step.
 - This button remains **disabled (greyed out)** until a CV file has been uploaded successfully (since a CV is required for analysis). If the user tries to click it with no CV uploaded, nothing happens; ideally also show a tooltip or inline prompt near the button or upload area indicating **“Vui lòng tải lên CV của bạn trước”** (Please upload your CV first) to guide the user.
 - Once a CV file is uploaded (and passes validation), the button becomes **active**. The user can click it to proceed. The presence or absence of a JD does not gate this button – JD is optional. However, if a JD URL or text is provided, it will be used for a better outcome.
 - An explanatory note can be displayed near the button or JD input area to remind users that adding a JD (though optional) will improve the analysis quality. For example, a small italic text: *“Thêm mô tả công việc sẽ giúp CV của bạn được tối ưu tốt hơn.”*

- **Secondary Action – “Tạo CV mới”:** For users who **don’t have a CV file to upload or prefer to start fresh**, provide a secondary option.
 - This can be a secondary button or simple text link labeled **“Tạo CV mới”** (Create a new CV) placed below or next to the primary button. It should be visible but less prominent than the primary CTA.
 - Clicking **“Tạo CV mới”** should immediately take the user into the **Guided Editing flow** for creating a CV from scratch. In this mode, the system will prompt the user with a minimal setup wizard (for example, asking for basic details like desired job title, company, etc., possibly using the existing guided bullet wizard components from the Work Experience editor). This allows the user to build a CV if they don’t have one, skipping the upload/analysis.
 - *Note:* The full implementation of the new CV creation wizard is outside the scope of this upload step spec. We will assume that flow exists or is handled separately. In this step, we just need to navigate the user to that flow if they choose to create a new CV.
- **Auto-Save of Inputs:** Every user input on this screen is automatically saved to the user’s draft profile in real-time, to prevent data loss and to streamline the experience.
 - When the user uploads a CV file, the file is immediately saved (e.g., uploaded to the server and associated with the user’s profile as a draft CV).
 - When the user pastes or types a JD (or enters a JD URL), that input is also saved momentarily after it’s entered (with appropriate debouncing to avoid excessive network calls). The draft JD (text or URL) is stored in the user’s profile.
 - This auto-save ensures that if the user refreshes the page or leaves and comes back, their uploaded CV and any JD they entered will still be there (the interface should load existing draft data on component mount if available).
 - Additionally, if the user does not complete the process (drops off), we have their progress saved so they can resume later without starting over.
- **States & Edge Cases:** The UI should handle various states clearly to the user:
 - **Empty State (initial):** No CV uploaded yet. The upload box is empty/neutral with instructions visible. The **“Bắt đầu phân tích”** button is disabled. Possibly an arrow or subtle highlight could draw attention to the upload box if needed, and a note indicates CV is required.

- **CV Uploaded State:** Once a file is uploaded, its details are shown as described, and the primary button becomes enabled. The user can proceed or optionally also input JD.
- **File Upload Error State:** If an error occurs (unsupported format or file too large), the interface should:
 - Show the error message (as above) near the upload box in a clear manner (red text or error callout).
 - Reset or allow the user to try another file immediately. The upload box could return to the neutral state (or remain showing the failed file name with an error indicator) – in either case, ensure the user knows they need to upload a valid file to continue.
 - The primary button stays disabled until a valid file is uploaded.
- **JD Input Error:** The main error case for JD is exceeding the character limit. If the user somehow surpasses 2000 characters (perhaps by paste), the extra characters beyond 2000 can be truncated or the field can stop accepting input. Additionally, highlight the counter in red and perhaps show a message like “*Văn bản quá dài, hãy rút gọn mô tả (tối đa 2000 ký tự).*” The “Bắt đầu phân tích” button should be disabled while the JD text is invalid (too long), prompting the user to shorten it. Once the text is within the limit, the error highlight is removed and the button (if CV is uploaded) can be active again.
- **No-JD scenario:** It’s perfectly fine if the user skips JD input. The UI should not guilt the user, but subtly encourage it. If no JD is provided, the analysis will still run but without job-specific tailoring. (We might consider a small note like “*Bạn có thể bỏ qua bước này nếu chưa có JD.*”)
- If the user uploaded a CV but then decides to use “Tạo CV mới” instead, we should probably warn that their uploaded file will be discarded (if that flow doesn’t use the file). However, since “Tạo CV mới” is more of an alternate path, clicking it could simply start a fresh session. (This is an edge-case decision: likely fine to just go to new CV editor and drop the uploaded file.)

Out of Scope

Requirements for CV Analyzing Loading Screen

User Story

As an OkBuddy, I want to know why and how I am waiting for the AI to analyze my CV and/ or JD

So that I can wait patiently without confusion

Features & Requirements

After the user clicks “**Bắt đầu phân tích**”, the app transitions to a dedicated loading/transition screen while the CV (and JD, if provided) are being “analyzed.” The purpose is to reassure the user that the system is working on their input and to create a smooth, branded experience before the editor appears.

- **Design & Branding:** This loading screen should be clean and on-brand. It likely covers the whole screen (or a modal overlay) with OkBuddy branding elements (e.g. logo or mascot, if any) and a simple background. The style should be consistent with the overall design system (modern, minimalist, friendly). For example, use the same font and color scheme defined in our design guidelines (soft cyan, mint green, light sky blue backgrounds, etc., consistent with earlier steps).
- **Progress Animation:** An **AI-themed analyzing animation** plays to engage the user. This could be a spinner or progress bar, or even an illustration (like a robot or magnifying glass) with subtle animation. Importantly, we will show **three text stages** that change to simulate progress:
 - “**Đang phân tích CV...**” – (Analyzing CV...) This message appears first, indicating the CV content is being analyzed.

- “**So sánh với JD...**” – (Comparing with JD...) Shown next, indicating the system is comparing the CV against the job description.
- “**Áp dụng đề xuất thay đổi...**” – (Applying suggested changes...) The final message, indicating that improvements/recommendations are being applied to the CV.

Each message is displayed in sequence, giving the impression of step-by-step processing. There can be a small dot animation or ellipsis that animates while each message is shown, reinforcing that work is being done.

- **Timing:** The entire loading sequence lasts approximately **4–6 seconds in total**. For example, each of the three stages might be shown for around 1.5–2 seconds before moving to the next. The transition between messages should be smooth (e.g. fading or sliding to the next text).
 - This duration is **not strictly tied to actual backend processing time**; it is primarily for UX. Even if the analysis completes faster, the animation should play for at least ~4 seconds to ensure the user sees the progression. Conversely, if backend processing takes longer than 4–6 seconds (which is unlikely for initial analysis), we might either extend the animation or loop a generic spinner until ready. The aim is to avoid leaving the user staring at a static screen.
- **Conditional JD Step:** If the user did **not provide a JD**, we may skip or shorten the “Comparing with JD” stage to avoid confusion. In such cases, the animation could either omit that step or pass through it very quickly. (This detail ensures the messages make sense in context.)
- **No User Action Needed:** The loading screen is purely informational/visual; there are no buttons or inputs. The user just watches the brief sequence. We should disable user navigation (or show no nav at all) during this process to keep them in flow (although a cancel option is generally not needed for such a short wait).
- **Automatic Transition:** After the ~5-second sequence, the application should automatically navigate the user to the **CV Guided Editing screen**, where they will see their CV content (either the uploaded one or a new blank one if they chose “new CV”) and a series of AI-driven suggestions and editing tools. The transition should happen without additional clicks. Possibly a fade-out of the loading screen into the editor interface.
- **Copy Configurability:** All text on this loading screen (and the upload screen) should be pulled from a configuration or localization file. For example, the messages “Đang phân tích CV...”, etc., should not be hard-coded strings, so that they can be easily edited or

translated in the future.

- **Feedback/Enjoyment:** This screen also serves to **set a positive tone**. We might include a brief friendly note like “Đang áp dụng trí tuệ nhân tạo để tối ưu CV của bạn...” in small text, or simply rely on the stage messages. Sound is not necessary (and likely should be avoided for user comfort), but visual delight is key. The user should feel that something intelligent and helpful is happening behind the scenes.
- **Error Handling:** (Rare case) If for some reason the analysis fails behind the scenes, the loading screen should still transition the user to the editor. In the worst case, the editor might load with the original CV and a generic set of suggestions or a notification about unable to fully analyze. However, handling of analysis failure is largely out of scope for this spec since the loading is mostly time-based. We assume the backend will handle analysis robustly within the time frame.

Note: All UI text mentioned (labels, messages, error texts) will be stored in a configurable manner (e.g., in a JSON or resource file for Vietnamese and other languages). This ensures we can easily update copy or localize to other languages in the future.
