

OkBuddy Product Brief

Overview

Problems & Opportunities

We want to leverage LLM to accelerate each step in the job searching process.

Step 1: CV preparation

Goal: Create the best CV

- Most updated
- Best presented
- Best customized (for a specific company)

Task	Need/ Problem	Solution	Pain Severity / Impact	C o s t	R a n k
Find most recent CV	As a job searcher, I have too many fragmented CVs with different versions to maintain across job sites throughout my career. HOWEVER, every time I want to apply for a new job, I have to find & retrieve the most recent version and work from there “Where is my most recently updated CV?”	Life-time job assistant - so that users naturally come back after each job & don't have to go anywhere else, having 1 centralized platform			
Update CV	As a ..., I have to update my CV, showcasing my most recent/ relevant experience. HOWEVER, manual writing takes too much time/ I find it hard to start writing or don't know what to write that would appeal hiring managers. “How do I showcase my experience that is				

	industry-standard quickly & efficiently?"				
	"How do I make my CV best customized for this company?" (customizing)				

Current Standard

Globally, job seekers often write resumes manually or use templating tools. LinkedIn offers a basic "Resume Assistant," and services like TopCV (Vietnam) provide templates or professional CV writing – but these produce generic documents unless the user painstakingly customizes them. There's little guidance on phrasing accomplishments or aligning a CV with a specific job's requirements, apart from one-size-fits-all advice.

LLM Disruptive Edge

LLMs can serve as on-demand expert resume writers. They understand context and can highlight a candidate's strengths in compelling language. An LLM can take a user's raw work history and *instantly generate a polished, personalized CV* tailored to a target job description. It can incorporate relevant keywords for Applicant Tracking Systems (ATS) automatically, something job seekers often struggle with. Essentially, the LLM combines the roles of a career coach and copywriter at scale.

10× Better Experience

An AI-powered resume assistant could dramatically outperform the status quo in several ways:

- Faster, Iterative Writing:** Instead of spending days drafting and editing, candidates can generate and refine multiple resume versions within minutes . This speed means one can easily customize a CV for each application (a practice that was too time-consuming before). Tools have already shown that integrating GPT allows creating and tailoring resumes "faster without needing to manually format or optimize for ATS scanning" . In short, what once took hours can be done in a fraction of the time, with formatting and keyword nuances handled by the AI.
- Highly Personalized Content:** LLMs produce resumes that sound like *you*, only better. They can emphasize the most impactful aspects of your experience in a professional tone, yielding *stronger, more personalized content than ever before* . This goes beyond template filling – the AI can, for example, rephrase a bullet like "Managed a team" into a stronger accomplishment ("Led a 5-person team to achieve 120% of sales targets"), tailored to what a given industry or role expects. Such nuance is rarely achieved by generic builders.

- **Job-Specific Tailoring:** An LLM can analyze a specific job posting and then **tailor the resume** to mirror the language and requirements of that post. Current local platforms like TopCV let users create a CV but do not dynamically adapt the content for each job. In contrast, an LLM could ensure your CV for a marketing role at Company X highlights your SEO and campaign skills, while a version for a management role at Company Y emphasizes leadership and strategy. This alignment can markedly increase the chance of getting noticed. In effect, the AI helps applicants “match skills and experience to specific jobs” effortlessly .
- **ATS Optimization and Clarity:** Many resumes are filtered out by ATS algorithms due to missing keywords or poor formatting. An LLM-driven system can automatically integrate relevant keywords and craft clear, scannable formatting. It *streamlines resume writing and optimizes content for ATS* , reducing the trial-and-error that applicants currently face. This means more resumes get past automated filters to human eyes – a huge improvement over the status quo where a qualified candidate might be overlooked due to a minor phrasing issue.

Overall, by combining speed, personalization, and expert guidance, an LLM-based CV prep feels like having a personal career assistant. It can help even inexperienced candidates produce a CV on par with those written by seasoned professionals, **far outpacing** what current global or local tools offer in usability and quality.

Step 2: Job matching

Goal: Find the best/ most suitable jobs on the market

- Best companies -> Hard to get attention
- Personal criteria for each person are unique:
 - ToC
 - Location
 - Expertise matching/ suitable
 - Further career advancement
 - Culture/ colleagues

Task	Need/ Problem	Solution	Pain Seve rity/ Impa ct	C o s t	R a n k
Checking if a potential company is hiring for my position	I want to quickly know if the best companies of my field/ industry are hiring and how suitable/ matching my experience/ CV is.	Aggregated with ranking/ matching suitable			

	HOWEVER, I'm very afraid that (1) FOMO I'm afraid of missing chances to work for company A, which is one of the best in this field - I might miss out good suitable opportunities (I do have to create a spreadsheet to track each company with link to their relevant job everyday) (2) Competition is too tough. "Is company X looking for this position I could potentially match?"				
Exploring/ browsing if there are open opportunities that could be a good match	I want to scan if there are open opportunities that potentially match my background & abilities. HOWEVER, ... (not a problem to prioritized)				
"Anything can work, I need to go to work now"	As a job searcher who's been unemployed for a while, I just want to find a job quickly to get a paycheck. HOWEVER, I'm not sure if the sites I go to suggest opportunities that could work for me ASAP	? Ranking/ filter to show least competition/ relevant job			

Current Standard

Finding the right jobs (and candidates) today is often a clunky keyword-driven process. Globally, LinkedIn and Glassdoor rely on filters (title, location, skills) and basic recommendation engines. Locally, VietnamWorks and ITviec list openings by category, but a user must manually sort through listings. This leads to frustration on both sides: applicants struggle to find fitting roles without endless scrolling, and recruiters get inundated with mismatched applications. In fact, LinkedIn found that hiring teams spend 3–5 hours a day sifting through applications, and less than half of those applicants meet the role's criteria ^[OBJ] – a huge efficiency problem.

LLM Disruptive Edge

LLMs can understand natural language and context in a way traditional search cannot. Instead of matching exact keywords, an LLM-powered job search engine grasps the intent behind a query or profile. For example, a user could type "I want a business development or partnerships

role in gaming, preferably at an international company” – a complex query that today’s job boards would fumble. An LLM can parse this request and the vast array of job descriptions to find roles that fit the concept (maybe “Strategic Partnerships Manager at a game studio”), even if the postings use different terms. Likewise on the recruiter side, an LLM could parse a job description and surface semantically suitable candidates, not just those who happen to use the same buzzwords.

Critically, LLMs excel at reading and summarizing text. They are “amazing at looking at a job description and extracting semantics and nuance from it” [OBJ]. This means an AI can infer, for instance, that a “Growth Lead in e-commerce” role likely requires analytical skills and knowledge of digital marketing, even if the posting doesn’t spell that out. It can then look for candidates whose profiles demonstrate those inferred attributes. This deeper understanding is a game-changer for matchmaking.

10× Better Experience

Here’s how an LLM-driven matching system could vastly improve the job search experience:

- **Conversational, Goal-Based Search:** Job seekers could describe their ideal role in plain language – including abstract goals or cross-domain interests – and the AI will find matches they might have otherwise missed. LinkedIn’s new AI search has already shown this capability, allowing users to type phrases like “using brand marketing skills to cure cancer” and discovering related roles in pharma that don’t explicitly say “cancer” [OBJ] [OBJ]. This is a far cry from today’s keyword search. The result is a more inspired job search: people can uncover opportunities (and companies) they wouldn’t have thought to look for, guided by the AI’s semantic understanding.
- **Better Fit, Less Noise:** Because an LLM matches on meaning, candidates get more relevant listings and fewer false leads. For example, someone with primarily front-end web experience won’t keep seeing “Java Developer” jobs just because their profile mentions “web development”. The AI “interprets the intent behind job seeker queries and job descriptions” to make smarter matches [OBJ]. Conversely, recruiters receive more qualified, context-appropriate applicants. An LLM is less likely to overlook relevant experience or skills a candidate has, even if they didn’t use the exact keywords [OBJ]. (For instance, the AI knows a web developer likely knows HTML/CSS even if not explicitly stated [OBJ].) This leads to time saved for both candidates and recruiters, as more of the applications align to what’s needed.
- **Personalized Recommendations & Guidance:** An LLM could act like a career concierge. Instead of a static list of postings, imagine a chatbot that learns your preferences (“I value work-life balance and creative freedom”) and suggests roles or companies that fit your values, not just your skills. Glassdoor provides company reviews and salaries, but an AI assistant could synthesize that info – “This company has a culture that might suit you, given what you told me”. This level of personalized matching is largely absent in current platforms. It could make the job hunt feel more curated and less like searching a giant database.
- **Pre-Application Fit Analysis:** To avoid the black hole of unqualified applications, an AI could provide a “fit score” or feedback before you even apply. LinkedIn has started doing

this with an AI “job match” feature that analyzes how closely your profile matches a job and highlights gaps [OBJ]. A standalone LLM platform could do the same: “You meet 8 of 10 requirements; here are two areas you might want to address in your CV or cover letter.” This helps candidates decide where to focus and coaches them on addressing weaknesses, creating a more educated applicant pool for recruiters.

- **Two-Way Discovery:** Not only can job seekers find roles, but recruiters can discover passive candidates in a smarter way. LLMs could comb through profiles (with permission) and suggest people who aren’t actively applying but are a great fit – essentially what LinkedIn Recruiter does, but with more nuance. For local markets, this could help overcome talent shortages by finding transferable skills. For example, an AI might suggest that a top performer in sales (not in tech) could transition to a Business Development role at a tech startup, expanding the candidate pipeline beyond the obvious. This kind of cross-pollination of opportunities is still nascent in local job sites.

In sum, LLM-driven job matching turns the hunt into more of a dialogue and intelligent recommendation process rather than a keyword slog. By interpreting intent, inferring skills, and learning user preferences, it can deliver matches with a relevance and breadth that feels almost consultative – 10× better in terms of efficiency and quality. This improves outcomes on both sides: job seekers find better fits faster, and hiring managers spend less time weeding out the wrong candidates.

Step 3: Application

Goal: Get to interview stage

Task	Need/ Problem	Solution	Pain Seve rity/ Impa ct	C o s t	R a n k
Apply	As a job searcher who’s been unemployed for a while, I just want to find a job quickly to get a paycheck	Mass application but still want to make sure they have the highest chance (customized)			
	As ... I have to manually fill in random ad-hoc question for almost every different companies. This is painful because I have to manually recall each experience, type it down every time, polish the writings each time.	Auto fill form LLM			
Keep track & manage	As a job searcher, I have to manage my CV and applications on too many platforms: LinkedIn,	Keep track of jobs users applied through OkBuddy Status of each stage &			

	Glassdoor (international), VietnamWorks, ITViec, TopDev (domestic) ... This is: Time-consuming Easy to miss out: I don't know/ not sure if I apply for a job twice/ FOMO I'm afraid of missing chances to work for company A, which is one of the best in this field Confusing: I'm not sure/ find it hard to keep track of all applications & status of each	notification			
--	--	--------------	--	--	--

Current Standard

The application step – filling out forms, writing cover letters, answering screening questions – is often tedious and repetitive. Globally, sites like LinkedIn offer “Easy Apply” (reusing your profile as an application), which is convenient but often means no tailored cover letter and a lower chance of standing out. Glassdoor typically redirects to company sites where applicants manually input information each time. Locally, many Vietnamese job platforms let you submit a CV but may not even support cover letters or have poor UX, leading candidates to skip personalization. The result is that candidates either spend a lot of time crafting individual applications (and thus apply to fewer jobs), or they submit generic, lower-quality applications in volume – neither approach is ideal.

LLM Disruptive Edge

LLMs shine at content generation and can dramatically streamline the application process. An LLM can auto-generate personalized application materials on the fly. For example, given a job description and a user's CV, the AI can draft a custom cover letter highlighting exactly the skills and experiences that match the job. It can also answer common application questions (“Describe a challenge you overcame at work”) in polished prose derived from the candidate's background. Essentially, the LLM acts as a tireless writing assistant that ensures every application is articulate and targeted, with minimal effort from the user.

Beyond writing, an LLM could help fill out application forms by extracting relevant info from your resume/profile and even pre-answering questions that it can infer (with user confirmation). It's like having an “auto-complete” for job applications that still produces thoughtful, human-quality responses.

10× Better Experience

An AI-driven application assistant could revolutionize this step in several ways:

- **Instant, Tailored Cover Letters:** Writing a tailored cover letter for each job is one of the most time-consuming parts of applying. With LLMs, this can happen in seconds. The AI can analyze the job description for keywords and priorities, then frame the candidate's experience to mirror those. This yields a highly customized letter that aligns with the role and company – something that would take a human hours of effort. According to career platform Teal, using AI for cover letter creation can “save hours... allowing you to apply to more jobs faster” [OBJ]. What used to be a tedious task now becomes almost effortless, freeing candidates to focus on opportunities they truly care about (or simply apply to more roles without burnout).
- **Consistent Quality and Storytelling:** An LLM ensures that the narrative across your application is cohesive. It will make sure your cover letter doesn't contradict your CV and that it emphasizes the same core story of why you're a fit. This consistency is hard to achieve when manually tweaking each application under time pressure. The AI, however, can maintain a professional tone and re-use key accomplishments in the right context. The result is a seamless pitch. As an example, if your resume shows you grew sales by 50%, the AI will mention that in your cover letter when talking about results-driven mindset, ensuring recruiters catch your biggest achievements. This helps candidates put their best foot forward every time.
- **Customized Responses at Scale:** Many applications include additional questions like “Why do you want to work here?” or “Describe a relevant project.” Crafting unique answers for each company is burdensome. LLMs can generate compelling, company-specific responses by drawing on both the candidate's experience and public information about the company (mission, culture). For instance, it might produce an answer that ties the candidate's values to the company's mission statement. Doing this manually for dozens of applications is practically impossible; with AI it becomes feasible, meaning applicants can truly tailor every aspect of an application, not just the resume/cover letter. This level of personalization at scale is unprecedented and would far surpass the generic applications currently the norm.
- **Error Reduction and Refinement:** The AI can double-check that the application is complete and well-written. It can flag if a candidate forgot to mention a required skill or if their answer is too short or long based on typical expectations. Essentially, it's an editor and proofreader. This reduces mistakes like forgetting to change the company name in a reused cover letter – a common faux pas today. For non-native language speakers (e.g. a Vietnamese applicant writing in English), an LLM can correct grammar and improve fluency, helping them compete on a level playing field with native speakers. The outcome is a polished application every time, whereas currently quality can vary widely from one application to the next.
- **Applying “Auto-Pilot” Mode:** In an extreme scenario, a job seeker could almost put the application process on auto-pilot: the LLM finds matching jobs and applies on the candidate's behalf with tailored documents, perhaps after getting user approval. While risky if fully automated, semi-automation (AI drafts everything, human approves) could 10× the volume of high-quality applications one person can manage. This flips the dynamic from reactive (manually applying job by job) to proactive (the AI continuously seeks and applies to opportunities that fit). None of the existing platforms offer such proactive assistance at present.

By leveraging LLMs for the application phase, candidates experience far less drudgery and can devote more energy to evaluating roles or preparing for interviews. Importantly, quality is not sacrificed for quantity – the AI makes it possible to have both. A user can apply to many more jobs and each application is thoughtfully customized. This is a significant improvement over today's trade-off between volume and personalization. For recruiters, this likely means receiving more compelling, well-written applications that make it easier to identify true fits (as opposed to weeding out boilerplate cover letters). Overall, the application stage becomes smoother, smarter, and drastically faster with an LLM in the loop.

Step 4: Interview

Out of scope.

Step 5: Negotiation

Out of scope.

Mission & Objective

Mission

Empower job seekers with intelligent, personalized, frictionless job search experiences through groundbreaking use of AI, making the pursuit of career opportunities effortless, precise, and successful.

Objective

Become the indispensable career assistant trusted by millions, dramatically accelerating and simplifying the process of finding and securing the right opportunities, starting from creating a stellar CV to successfully landing interviews.

Tenets

AI Leverage as our MOAT

We leverage cutting-edge Large Language Models (LLMs) to deliver unparalleled personalization and responsiveness. Our technology isn't just a feature—it's the very core of our competitive advantage.

User Empowerment First

Every interaction, suggestion, or solution provided by OkBuddy empowers users with clear, actionable insights. We optimize relentlessly for simplicity, clarity, and utility to ensure users feel confident and supported.

Radically Personalized Experiences

Generic advice has no place in OkBuddy. We deeply tailor every recommendation, CV enhancement, job match, and application aid to the individual user, their unique career ambitions, and targeted roles.

Data-Driven Trust & Transparency

We actively maintain transparency in how we leverage user data and generate AI insights. Users trust us because we clearly demonstrate our recommendations' reliability, accuracy, and fairness.

Holistic and Continuous Value

OkBuddy isn't transactional—it's relational. Our platform continuously engages users throughout their careers, evolving alongside their professional journeys and always remaining relevant, useful, and up-to-date.

Vision/ Magic Wand

Imagine OkBuddy as your lifelong career companion—a hyper-personalized AI mentor who intimately understands your career goals, skills, aspirations, and preferences. You simply describe your dream job, and OkBuddy instantly delivers a crystal-clear, actionable roadmap:

Instantly Customized CV

Your resume is always dynamically updated and perfectly tailored for each opportunity, fully optimized for ATS and human recruiters alike.

Effortless & Inspired Job Discovery

Forget keywords—describe your ideal role conversationally, and instantly discover hidden opportunities perfectly matched to your professional desires, cultural fit, and career growth aspirations.

Autonomous, Personalized Application Assistant

Each application, from cover letters to form-filling, is precisely and automatically tailored—each word, experience, and achievement carefully chosen to maximize your success.

Total Application Visibility & Management

Never wonder again about the status of your applications or worry about missing opportunities. Your personal assistant manages every application across every platform, continuously providing clarity, guidance, and proactive follow-up.

Ultimately, OkBuddy completely redefines the job-seeking experience: no friction, no uncertainty—just effortless progression toward your dream career.

Hypotheses

Vietnam market has mostly small medium businesses which post jobs on top platforms like: TopCV, VietnamWorks, ITViec ... which already automate job application through single-click, thus the need for something like automating job form filling isn't as big as US where top tier corps (MAANG) have their own sites which require manual CV upload & form filling.
